

1. Install the required packages

Open a terminal in the project folder and run:

```
pip install fastapi uvicorn requests beautifulsoup4 python-dotenv  
openai pypdf python-docx python-pptx python-multipart
```

2. Create the .env file

In the same folder as your Python file:

```
OPENAI_API_KEY=your_openai_api_key
```

3. Make sure your project structure is:

```
VC-Brain/  
├── main.py  
├── .env  
├── frontend/  
│   └── index.html  
└── uploads/
```

The uploads folder is automatically created by the program if it does not exist.

4. Run the application

If your Python file is called `main.py`:

```
uvicorn main:app --reload
```

If it is called something else, for example `server.py`:

```
uvicorn server:app --reload
```

5. Open the application

Go to:

<http://127.0.0.1:8000/app>
